• Mean-field induction equation (Steenbeck & Krause, 1969):

$$\frac{\partial \overline{\boldsymbol{B}}}{\partial t} = \boldsymbol{\nabla} \times \left(\overline{\boldsymbol{U}} \times \overline{\boldsymbol{B}} + \overline{\boldsymbol{\mathcal{E}}} - \eta_{\mathrm{m}} \boldsymbol{\nabla} \times \overline{\boldsymbol{B}} \right), \tag{1}$$

with $\overline{\boldsymbol{\mathcal{E}}} = \alpha \overline{\boldsymbol{B}} - \eta_t \mu_0 \overline{\boldsymbol{J}}$,

• Spherical coordinates and axisymmetry: $\overline{B} = B\hat{e}_{\phi} + \nabla \times (A\hat{e}_{\phi})$ and $\overline{U} = r \sin \theta \Omega \hat{e}_{\phi} + u_{p}$

Results in:

$$\frac{\partial B}{\partial t} = s \boldsymbol{B}_{p} \cdot \boldsymbol{\nabla} \Omega - \left[\boldsymbol{\nabla} \eta \times (\boldsymbol{\nabla} \times B \hat{\boldsymbol{e}}_{\phi})\right]_{\phi} + \eta D^{2} B , \quad , \qquad (2)$$
$$\frac{\partial A}{\partial t} = \alpha B + \eta D^{2} A , \qquad (3)$$

$$\frac{\partial \alpha_{\rm M}}{\partial t} = -2\eta_{\rm t} k_{\rm f}^2 \left(\frac{\overline{\boldsymbol{\mathcal{E}}} \cdot \overline{\boldsymbol{\mathcal{B}}}}{B_{\rm eq}^2} + \frac{\alpha_{\rm M}}{R_{\rm m}} \right) - \boldsymbol{\nabla} \cdot \overline{\boldsymbol{\mathcal{F}}}_{\alpha} ,$$

< ロ > < 同 > < 回 > < 回 >

Magnetic helicity fluxes, diffusive flux

• $h_{\rm f}$ (or $\alpha_{\rm M}$) diffuses following a Fickian diffusion law: $F_{\rm D} = -\kappa_{\alpha} \nabla \alpha_{\rm M}$

- $\kappa_{\alpha} \sim (0.1 0.3) \eta_{\rm t}$
- Diffusion of h_f is gauge independent

(see Simon Candelaresi poster)

B > < B >

Magnetic helicity fluxes, Vishniac-Cho flux

 Magnetic field grows faster in simulations with open boundary conditions allowing magnetic helicity flux (e.g. Käpylä et al. 2008).

• Vishniac & Cho, 2001, Brandenburg & Subramanian, 2005

$$\overline{\mathcal{F}}_{i}^{\mathrm{VC}} = \mathcal{C}_{\mathrm{VC}}\epsilon_{ijl}\overline{\mathsf{S}}_{lk}\overline{B}_{j}\overline{B}_{k}$$

where $\overline{S}_{\textit{lk}} = \frac{1}{2} (\overline{U}_{\textit{l},k} + \overline{U}_{\textit{k},l}),$ $C_{\rm VC}$ is a scaling factor.

Model

Model (Guerrero et al. 2010)

$$\begin{split} &\frac{\partial \boldsymbol{B}}{\partial t} &= \boldsymbol{s} \boldsymbol{B}_{\mathrm{p}} \cdot \boldsymbol{\nabla} \Omega - \left[\boldsymbol{\nabla} \eta \times (\boldsymbol{\nabla} \times \boldsymbol{B} \hat{\boldsymbol{e}}_{\phi})\right]_{\phi} + \eta D^{2} \boldsymbol{B} \quad , \\ &\frac{\partial \boldsymbol{A}}{\partial t} &= \alpha \boldsymbol{B} + \eta D^{2} \boldsymbol{A} \; , \\ &\frac{\partial \alpha_{\mathrm{M}}}{\partial t} &= -2 \eta_{\mathrm{t}} \boldsymbol{k}_{\mathrm{f}}^{2} \left(\frac{\overline{\boldsymbol{\mathcal{E}}} \cdot \overline{\boldsymbol{B}}}{B_{\mathrm{eq}}^{2}} + \frac{\alpha_{\mathrm{M}}}{R_{\mathrm{m}}} \right) - \boldsymbol{\nabla} \cdot \overline{\boldsymbol{\mathcal{F}}}_{\alpha} \end{split}$$

BC's: A = B = 0 (poles), $A = \partial (rB)/\partial r = 0$ (bottom), $(\nabla^2 - s^{-2})A = 0$ (top).

G. Guerrero (NORDITA)

Results: *Dynamical* α *quenching*, $\overline{F}_{\alpha} = \mathbf{0}$

G. Guerrero (NORDITA)

MFPO, Krakow, May 2008

Results: *diffusive flux*, $\overline{\boldsymbol{\mathcal{F}}}_{\alpha} = -\kappa_{\alpha} \boldsymbol{\nabla} \alpha_{\mathbf{M}}$

G. Guerrero (NORDITA)

MFPO, Krakow, May 2008

Results: *VC flux*: $\overline{\mathcal{F}}_{\alpha} = C_{VC} \epsilon_{ijl} \overline{S}_{lk} \overline{B}_{j} \overline{B}_{k}$, radial shear

G. Guerrero (NORDITA)

Results: VC flux: $\overline{\mathcal{F}}_{\alpha} = C_{VC} \epsilon_{ijl} \overline{S}_{lk} \overline{B}_{j} \overline{B}_{k}$, latitudinal shear

Results: Parker's interface dynamo model

G. Guerrero (NORDITA)

- Diffusive fluxes alleviate catastrophic quenching of the dynamo for models with the solar conditions.
- Not the same for the Vishniac-Cho flux.
- VC-flux modifies the distribution of the magnetic field.
- For higher scaling factor, the VC-flux may develop local dynamo action.
- Catastrophic quenching is not alleviated by separating the dynamo layers. It implies that it is necessary to take into account a proper description of the quenching mechanism.

- Realistic solar dynamo models with differential rotation and meridional circulation profiles.
- Explore the effects of different helicity fluxes.
- Consider η_t and α quenching simultaneously.
- Compare mean-field models with DNS in spherical geometry.
