# Magnetic fields in and beyond clusters of galaxies

Klaus Dolag

Max-Planck-Institut für Astrophysik

19/5/2010 – p. 1

#### Outline

#### • Simulating magnetic fields in galaxy clusters

- Observations of cluster magnetic fields
- Hierarchical buildup of magnetic fields
- Applications
  - Propagation of UHECRs
  - RM-galaxy correlation to measure cosmic magnetization
  - Measuring low magnetic fields
- Constraining ICM properties
  - Profile of magnetic field ?
  - Minimal length-scale of cluster fields ?

F. Stasyszyn (MPA), J. Donnert (MPA) and A. Bonafede (IRA)

#### **Observed Magnetic Fields** $B(r) = B_0 \left(1 + (r/r_c)^2\right)^{-1.5\mu}, \ |B_k|^2 \propto k^{-n}, \ (k_{\min}, k_{\max})$

Bonafede et al. 2010

#### **Observed Magnetic Fields**

•  $S(dx, dy) = \left\langle \left[ RM(x, y) - RM(x + dx, y + dy) \right]^2 \right\rangle$ 

•  $A(dx, dy) = \langle RM(x, y) \times RM(x + dx, y + dy) \rangle$ 

•  $\langle |RM| \rangle_{\text{scale}}$ ,  $\langle \sigma_{\text{RM}} \rangle_{\text{scale}}$ ,  $n = 2, \Lambda_{\text{max}} = 102 \text{kpc}$ 

#### **Observed Magnetic Fields**

•  $S(dx, dy) = \left\langle \left[ RM(x, y) - RM(x + dx, y + dy) \right]^2 \right\rangle$ 

•  $A(dx, dy) = \langle RM(x, y) \times RM(x + dx, y + dy) \rangle$ 

•  $\langle |RM| \rangle_{\text{scale}}$ ,  $\langle \sigma_{\text{RM}} \rangle_{\text{scale}}$ , n = 11/3,  $\Lambda_{\text{max}} = 24 \text{kpc}$ 

#### **Observed Magnetic Fields** $B(r) = B_0 \left(1 + (r/r_c)^2\right)^{-1.5\mu}, \ |B_k|^2 \propto k^{-n}, \ (k_{\min}, k_{\max})$

- Degeneration of injection scale  $k_{\min}$  and spectral index n
- Knowing the spectrum constrains magnetic field
- $\Rightarrow$  Cosmological MHD simulations

# **Origin of Magnetic Fields**

#### Origin

- Primordial
- Battery
- Dynamo (Turbulence)
- Stars
- Supernovae
- Galactic Winds
- AGNs, Jets
- Shocks

Rees 1994

+ further amplification by structure formation
- dissipation ?

#### **Simulation Network**

# **Cosmological MHD simulations**

#### "Zoomed" cluster simulation (Dolag & Stasyszyn 2009). Movie: u,v

19/5/2010 – p. 6

Simulating the magnetic field amplification during galaxy mergers like in the Antennae system. Final magnetic field strength and field configuration in broad agreement with observations.

(Chyzy & Beck 2005

Kortarba et al. 2010)

Simulating the magnetic field amplification during galaxy mergers like in the Antennae system. Final magnetic field strength and field configuration in broad agreement with observations.

Final magnetic field close to equipartition with turbulent velocity component, largely independent of initial field values.  $\Rightarrow$  Hierarchical buildup of magnetic field

Final magnetic field close to equipartition with turbulent velocity component, quasi independent of initial field values.

 $\Rightarrow$  Hierarchical buildup of magnetic field

<sup>(</sup>Kortarba et al. 2010)

19/5/2010 – р. 7

Seeding from galactic outflows (Donnert et al. 2009)

Full sky deflection signal for  $4 \times 10^{19}$ eV Cosmic Rays without losses, using a sphere of 110 Mpc radius and  $B_0 = 10^{-5} \mu$ G (Dolag, Grasso, Springel & Tkachev 2004)

![](_page_18_Figure_2.jpeg)

Full sky deflection signal for  $4 \times 10^{19}$ eV Cosmic Rays without losses, using a sphere of 110 Mpc radius  $B_0 = 0.2 \times 10^{-5} \mu$ G (Dolag, Grasso, Springel & Tkachev 2005)

![](_page_19_Figure_2.jpeg)

Full sky deflection signal for  $4 \times 10^{19}$ eV Cosmic Rays without losses, using a sphere of 110 Mpc radius from galactic outflows (Just for you !)

![](_page_20_Figure_2.jpeg)

Sky coverage of deflection signal for  $4 \times 10^{19}$ eV Cosmic Rays without losses, using a sphere of 110 Mpc radius for all models (Also just for you !)

![](_page_21_Figure_1.jpeg)

Pierre Auger Observatory provides evidence for anisotropy in the arrival directions of the Cosmic Rays with the highest energies, which are correlated with the positions of relatively nearby active galactic nuclei (AGNs).

(Pierre Auger Collaboration 2008)

![](_page_22_Figure_2.jpeg)

Mean magnetic field as a function of density for various models.

![](_page_23_Figure_1.jpeg)

Full sky maps for the local universe showing the magnetic field and galaxy distribution.

![](_page_24_Picture_1.jpeg)

Model foreground based on HAMMURABI (Waelkens et al. 2009), cosmic signal and observational noise compared to observations.

![](_page_24_Picture_3.jpeg)

Same but smoothed by 8 degrees.

Stasyszyn et al. 2010

![](_page_25_Picture_1.jpeg)

#### Same as before, but with foreground removal.

![](_page_25_Figure_3.jpeg)

Reduced noise (1 rad/ $m^2$ ) and zoom on several clusters. Stasyszyn et al. 2010

![](_page_26_Figure_1.jpeg)

Correlation functions (based on 3072 RMs):

$$\omega_{\rm RM}(\theta) \equiv \frac{\langle \Delta n(\theta) | {\rm RM} | \rangle}{\bar{n} | {\rm RM} |},$$

(normalized)

$$\xi_{\rm RM}(\theta) \equiv \frac{\langle \Delta n(\theta) | {\rm RM} | \rangle}{\bar{n}}.$$

(unnormalized). Stasyszyn et al. 2010

![](_page_27_Figure_1.jpeg)

Influence of the different components onto the correlation signal:

- Cosmological signal (CS)
- Including galactic foreground and applying removal
- Adding only noise  $(1 \text{ rad}/m^2)$  to the signal (CS+N)
- All effects together

Stasyszyn et al. 2010

![](_page_28_Figure_1.jpeg)

Correlation signal from different model (Stasyszyn et al. 2010).

19/5/2010 – р. 9

![](_page_29_Figure_1.jpeg)

Correlation signal predicted by simulations, but the amplitude is driven by the foreground and observational noise !

19/5/2010 – р. 9

### Measuring low magnetic fields

![](_page_30_Figure_2.jpeg)

Halo found stacking 170 AGNs with FERMI:  $B \approx 10^{-15}$ G.

#### Measuring low magnetic fields

![](_page_31_Figure_1.jpeg)

Perfectly in line with predictions by simulations.

![](_page_32_Figure_2.jpeg)

Bonafede et al., work in progress

$$\frac{\mathrm{d}\vec{B}}{\mathrm{d}t} = (\vec{B}\cdot\vec{\nabla})\vec{v} - \vec{B}(\vec{\nabla}\cdot\vec{v}) + \eta\vec{\nabla}^2\vec{B}$$

19/5/2010 – р. 11

![](_page_33_Figure_2.jpeg)

Observed and simulated RM maps up to the highest resolution simulation: 20 Million particles within  $R_{vir}$ ,  $m_{DM} = 10^7 M_{\odot}/h$ ,  $\epsilon_{Grav} = 1$ kpc/h (Stasyszyn & Dolag, work in progress)

![](_page_34_Figure_2.jpeg)

19/5/2010 – р. 11

![](_page_35_Figure_2.jpeg)

Structure functions derived from observed and simulated RM maps up to the highest resolution simulation: Indication for need of magnetic dissipation (Stasyszyn & Dolag, work in progress)

#### Conclusions

**Cosmological MHD simulations** 

- Reproduce overall picture well
- Low density regions encode origin if magnetic field
- Details need better understanding of dissipative processes
- Important to test observational strategies
   Applications:
  - UHECR propagation consistent with observations
  - RM-Galaxy correlation consistent (foreground / noise !)
  - Observed Blazar halos consistent with predictions

Questions on magnetic fields:

- Minimal length-scale of cluster fields ?
- Detailed magnetic field profile shape ?

#### Outlook

![](_page_37_Picture_2.jpeg)

Simulation by P. Mendygral
